

## THE DRUG "OMARIDIN" PRODUCTION LLC ECO 777 LTD.

The company's specialists have been studying and testing the properties of antibiotic proteins in EU countries for more than twenty years.

In Ukraine, the drug appears for the first time. In the absence of analogs in the world practice, the combination of 100 grams of the reconstituted drug contains:

- Protein is more than 40%
- Carbohydrates is less than 13%
- Fat is less than 2.5%

The drug has the following biological properties:

OMARIDIN is an important biological regulator of immunity. It is used both for preventive and therapeutic purposes.

As part of the drug, there are no proteins that are constructed from non-food D (right-turning) - amino acids.

One of the most important factors of the drug is the suspension of the aging of the organism, the transformation of the change of amino acid D, L-methionine into a dangerous substance - homocysteine, which initiates premature apoptosis.

OMARIDIN contains the sulfhydryl groups (SH) required for the usual diet, which provides a detoxification function of the liver. It is easily digestible in the human body at the expense of the perfect balance of food L-amino acids, it does not contain atypical proteins - allergens. Protects the human body from pathogenic bacterial flora, enhancing cellular immunity by activating macrophages.

The drug is able to introduce into free structures inorganic forms of such important microelements as iron, copper, zinc, selenium, which helps to create their optimal balance in the body, optimizing the function of the hematopoietic system, the immune system, increasing muscle activity.

Under the action of the drug increases antitumor immunity, increased metabolic processes, decreases the formation of connective tissue in the liver, joints and other organs.
