

® Program / Delay of the aging processes of the human body has been scientifically proven.

The aging of an organism is characterized by a progressive loss of the physiological integrity of the biosystem. This leads to a violation of the function of the genotype, provoking its vulnerability with subsequent death.

Such a process is the main risk factor for “sleeping” human pathologies, which, “waking up” at an “inconvenient” time, can provoke not very pleasant physiological processes in the body, including disorders of the gastrointestinal tract, the development of malignant tumors (cancer), diabetes, cardiovascular disease, neurodegenerative diseases and much more.

In recent years, the study of aging has received unprecedented attention, in particular due to the discovery of information that its rate is controlled - at least to some extent - by genetic pathways and biochemical processes preserved in evolution.

These characteristics are: genomic instability, telomere depletion, epigenetic alterations, loss of proteostasis, dysregulated nutrient absorption, mitochondrial dysfunction, cell aging, stem cell depletion, altered intercellular communication, etc.

Competitors' favorite is the focus on pharmaceuticals. It is regrettable that these competitors insist on the use of artificially synthesized chemical compounds, entailing numerous side effects, and relying on knowledge in the unipolar sphere of biosystem development.

Unlike competitors, the algorithm of the patented Immanent Therapy **® Program / Delaying the aging process of the human body** successfully achieves the desired result; including the complex and holistic approach to solving this issue [exclusively with products of natural origin](#).
